**CADdetails Introduces Product Builder System**

LONDON, ONTARIO - August 18<sup>th</sup>, 2005 - CADdetails Ltd., the industry leader in developing and cataloguing predefined CAD drawings and specifications for hundreds of manufacturers, announces the release of a new system specifically designed to handle high volumes of product configurations.

The state of the art 'Product Builder System' is a logical, versatile program backed by the most sophisticated parametric CAD engine available today. Using complex template files, asp.net programming language and command line scripts, the system allows designers to pick and choose from literally 100's of product options. The end result - specially configured 2-D CAD details, 3-D render ready models and 3-part specifications, ready to download.

Take a window manufacturer for example;

The company might offer as many as 10 window styles, 10 heights, 8 widths, 4 glazing options, 4 grill styles and various hardware and material choices. This alone is at least 64,000 possible product configurations, before you add color and custom sizes. Such manufacturers can benefit from a customer driven system that allows designers to generate the desired CAD drawing or specification to meet their specific needs on the fly. An easy-to-use interface gives manufacturers total control in adding, removing and managing parameter values for complete product families or product configurations.

This new technology is destined to be the foundation of CADdetails web-based "Architectural Design Center" and will serve up 2-D drawings and 3-D models compatible with 97% of the industries leading CAD software programs.
